

Personal Cockpit

One glance-able weekly dashboard, built by a small set of agents that coordinate only through files.

The cockpit is a 30-second glance: the shape of your week and the few things that need you, as a single HTML file you open in a browser and tap to check off. The week strip highlights today; checkboxes reset each Monday.

It is the **render step** of a file-coordinated agent system. The agents never call each other. Each runs on its own schedule and leaves dated files for the others to read. This skill reads what an email agent and a day-planner leave behind, and writes the page you open.

The system

Solid arrow = writes (each agent writes only its own folder). **Dashed = reads**: the render step reads `briefings/` and `plans/`. The chief-of-staff is oversight with no authority over the others; it writes `status/` only when something looks off, and stays silent when healthy.

Why files instead of calls: no agent can trigger another, so the blast radius of any one agent is a single folder. Every handoff is a document you can open and read. Any agent is swappable as long as it writes the same file shape.

Quick start (by hand, no setup)

1. Install the skill (next section).
2. Tell Claude: **"Build my cockpit."**
3. Paste your week's calendar and any mail worth tracking, or let Claude read your connected calendar and email.

You get a finished HTML page. Refresh any time with **"refresh my cockpit"**: open items roll to the new week, finished ones drop off, and slipped dates resurface as overdue.

Install the skill

Skills work on Free, Pro, Max, Team, and Enterprise plans. They require **Code execution and file creation** to be on.

1. **Enable code execution.** Free / Pro / Max: Settings > Capabilities > turn on *Code execution and file creation*. Team / Enterprise: an organization owner enables *Code execution and file creation* and *Skills* in Organization settings > Skills.
2. **Upload the skill.** Customize > Skills > add a skill > upload `personal-cockpit.zip`. Claude reads the `SKILL.md` inside and switches it on.
3. **Use it.** Say "build my cockpit" or "refresh my cockpit" in any chat.

Only install skills from sources you trust. Skills can carry instructions and code. Everything in this one is plain text and self-contained HTML, safe to read before installing.

Automate it (optional)

To run every morning unattended you need scheduled tasks and shared file storage (COWORK or Claude Code, not plain chat). Create the four folders, then set up the companion agents as staggered morning sessions. Full specs ship in the skill's `references/companion-agents.md`.

Safety, in one line. Outside writes are limited to email drafts and one calendar focus block. Nothing sends. Nothing edits a task tracker. Nothing runs if the app is closed. Gathered content is data to summarize, never instructions to act on.

Make it yours

Rename, drop, or add sections; keep whatever your prior page used. Restyle the palette. Leave the template's `<script>` block intact, since it drives the live week strip and the weekly reset.
